Garden Party Reservation Website

Introduction of works

With the gradual rise of the era of online shopping, this group combines reservation shopping websites with garden parties. Use the relational database to provide different server dynamic web page designs, and then use CSS and HTML to form the front-end web page. Based on the above two techniques, a garden party booking website was created.

Grab the information from the database and divide it into food, drink, and clothing

- Grab data from database and classify subject groups
- Render data table content
- Editable purchase quantity, write back to database
- Fill in customer information and write it into the database
- Get the transactions made by this account from the database
- Add new items and write them into the database
- Change the existing product name, unit price, inventory, content, write it into the database, and update it at any time
- When the buyer finishes shopping, the seller will confirm again, which means that he has received the
